## **Investigating places with Geography: Iceland**

To be able to use maps of Iceland to describe its geography.

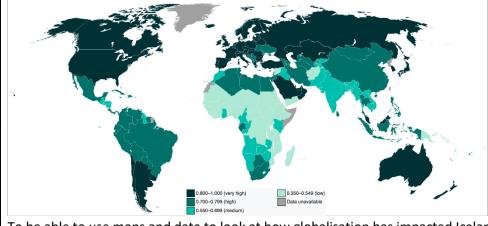

To be able to suggest three appropriate questions to investigate the geography of Iceland. How does Icelands geography influence it's environment? Where do the people of Iceland live and why? How developed is Iceland? How globalised is Iceland? Why do we get tectonic activity in Iceland?

To be able to explain two ways that Iceland was formed?

Two plates are pulled apart by convection currents. Magma rises up to plug the gap between the plates forming volcanoes. As this magma cools it forms new land in this case forming the island of Iceland.

Within the mantle, there will be some radioactive material which will be decaying, as the material decays a radioactive reaction occurs which leaders to a localised temperature increase and a vertical plume of material towards the surface. As the materials reaches the surface of the crust it melts through eventually reaching the outside, here it solidifies and forms volcanos.

To be able to use maps and data to investigate the level of development of Iceland.

To be able to use maps and data to look at how globalisation has impacted Iceland.
